1. For a graph $G=(V, E)$, denote $d(v)$ to be the degree of a vertex $v(v \in V)$, where the degree of a vertex is the number of edges incident to it. Show that for any graph $G=(V, E)$,

$$
\sum_{v \in V} d(v)=2|E|
$$

2. Show that every simple graph (no self-edges or multi-edges) has two vertices of the same degree.
3. A graph is called "complete" if it has all possible edges - every pair of vertices has an edge between them. How many edges does a complete graph on $n$ vertices have?
4. Show that a graph on $n$ vertices with $n$ edges has a cycle.
5. Suppose that for $G=(V, E), \max _{v \in V} \operatorname{deg}(v) \leq \Delta$. Show that $V$ can be colored with at most $\Delta+1$ colors, such that no two neighboring vertices are of the same color.
6. (a) A perfect matching in a graph $G=(V, E)$ is a set of disjoint edges $M \subseteq E$ such that there is an edge incident to every vertex of $G$. A bipartite graph is a graph in which there is a partition of a vertex set $V=A \cup B$ such that every edge is incident to one vertex in $A$ and one vertex in $B$. What conditions do we have to have on $A$ and $B$ if there is a perfect matching?
(b) Use the previous part to show that you cannot tile an $8 \times 8$ chessboard with opposite corners removed using $2 \times 1$ tiles.
7. In a graph $G$ with $n$ vertices and $m$ edges, show that there exists an induced subgraph $H$ with each vertex having degree at least $\frac{m}{n}$.
8. Let S be a set of n points in the plane such that the greatest distance between two points of $S$ is 1 . Show that at most $n$ pairs of points of $S$ are at distance 1 apart.
9. Show that it is possible to partition the vertex set $V$ of a graph $G$ on $n$ vertices into two sets $V_{1}$ and $V_{2}$ such that any vertex in $V_{1}$ has at least as many neighbors in $V_{2}$ as in $V_{1}$, and any vertex in $V_{2}$ has at least as many neighbors in $V_{1}$ as in $V_{2}$.
10. A town has $3 n$ citizens. Any two persons in the town have at least one common friend in this same town. Show that one can choose a group consisting of $n$ citizens such that every person of the remaining 2 n citizens has at least one friend in this group of $n$.
11. Let $T$ be a tree with $t$ vertices, and let $G$ be a graph with $n$ vertices. Show that if $G$ has at least $(t-1) n$ edges, then $G$ has a subgraph isomorphic to $T$.
